

NBT/BCIP Stock Solution

Cat. No. 11 681 451 001

8 ml

Version 08

Content version: April 2016

Store at +2 to +8°C

Product overview

Content

Solution of
• 18.75 mg/ml NBT (Nitro blue tetrazolium chloride)
and
• 9.4 mg/ml BCIP (5-Bromo-4-chloro-3-indolyl phosphate, toluidine salt) in 67% DMSO (v/v).

Note: The color of the solution can vary between yellowish to light brown.

Storage/ stability

The unopened reagent is stable at +2 to +8°C until the expiration date printed on the label or at least for 4 weeks at +15 to +25°C stored protected from light.

Note: If precipitates occur in the color substrate solution, they can be removed by warming up the solution to +50°C. If the precipitates do not resolve centrifuge the tube prior to use because the precipitates might cause background; centrifugation will not reduce the overall sensitivity.

Preparation of staining solution

Always prepare this solution fresh shortly before use!

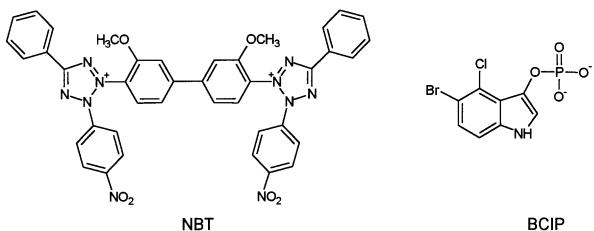

- For all applications except DIG System: Add 200 µl of the stock solution to 10 ml 0.1 M Tris-HCl, pH 9.5 (20°C), 0.1 M NaCl, 0.05 M MgCl₂.
- For DIG System applications: Add 200 µl of the stock solution to 10 ml 0.1 M Tris-HCl, pH 9.5 (20°C), 0.1 M NaCl

Note: Do not include MgCl₂ in the detection buffer as this might lead to spotty background on the membrane after the detection procedure.

Properties

	NBT	BCIP
Formulas	C ₄₀ H ₃₀ C ₁₂ N ₁₀ O ₆	C ₈ H ₆ NO ₄ BrCIP x C ₇ H ₉ N
Molecular weight	817.7	433.6

Structures

Application

The solution is used for the sensitive detection of alkaline phosphatase.

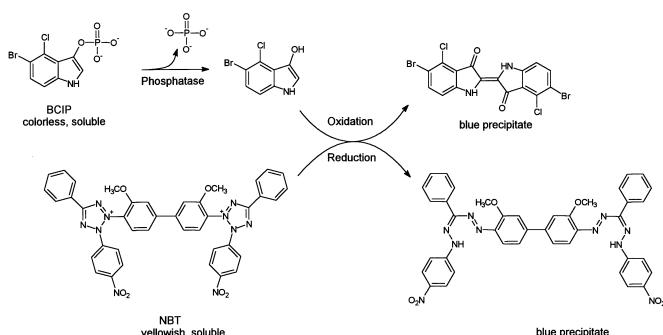

Both dyes have very little solubility in water or lipid and can be applied for the

- AP-detection in immunoblotting (3) and
- immunohistochemical (4) assays.

Reaction scheme

BCIP (1) is the AP-substrate which reacts further after the dephosphorylation to give a dark-blue indigo-dye as an oxidation product. NBT (2) serves herein as the oxidant and gives also a dark-blue dye. It intensifies thereby the color and makes the detection more sensitive.

Scheme for the dye-generating redox reaction:

Immunodetection of digoxigenin-labeled biomolecules

The staining solution can generally be used for the detection of nucleic acids, proteins and glycoconjugates.

Please follow the Instructions for Use (available on request and on our web site) of the following kits:

- DIG-High Prime DNA Labeling and Detection Starter Kit I*,
- DIG DNA Labeling and Detection Kit,
- DIG Nucleic Acid Detection Kit,
- DIG Glycan Differentiation Kit.

The staining solution mentioned above can substitute the individual staining solutions in these kits.

Immunodetection of biotin-labeled glycoconjugates and proteins

Additional required reagents:

- TBS: 0.05 M Tris-HCl*, 0.15 M NaCl, pH 7.5.
- Streptavidin-AP-conjugate
- Tween 20*
- Blocking solution: Dissolve 0.5 g Blocking reagent* in 100 ml TBS, pH 7.5, by heating to +50 to +60°C (1 h). The dissolution can be accelerated by sonication or by incubation in a microwave oven. The solution remains turbid.

Protocol

Incubate all filters by gentle agitation at +15 to +25°C except for color development which should be done without any motion.

Note: The volumes state below refer to a 50 - 100 cm² filter.

Step	Action
1	Incubate the filter with the immobilized biotin-labeled samples for at least 30 min on approx. 20 ml Blocking solution. (The procedure can be interrupted at this stage if necessary and the filter can be kept in the Blocking solution at +4°C.)
2	Wash 3 times for 10 min each with approx. 50 ml TBS.
3	Incubation with streptavidin-AP: Add 5 µl of the conjugate to 10 ml TBS, 0.1% Tween 20 (w/v) and incubate the filter with this solution for 1 h.
4	Wash 3 times for 10 min each with approx. 50 ml TBS.
5	<ul style="list-style-type: none"> • Immerse the filter without agitation in the staining solution (preparation see above) and observe the development of the blue color. The development is normally completed within minutes but can take for up to one hour or even overnight if very little sample is present. • The detection depends highly on the nature of the biotin-labeled sample. Rinse the filter several times with double dist. water to stop staining then dry the filter on paper towels. • The filter can now be photographed or photocopied directly and can be stored under light protection for documentation.

In Situ Hybridization

For non-radioactive *in situ* Hybridization with alkaline phosphatase and NBT/BCIP chromogen it is important **not to** use xylene-based mounting media because these could lead to crystal formations of the color precipitates.
